PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/520,471	Applicant(s) HUSSON ET AL.	
	Examiner ERNST V. ARNOLD	Art Unit 1616	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period **will** apply and **will** expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply **will**, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 17 July 2008.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 9-28 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 9-28 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 7/17/08 has been entered.

Claims 1-8 have been cancelled. Claims 9-28 are pending and under examination.

Withdrawn rejections:

Applicant's amendments and arguments filed 7/17/08 are acknowledged and have been fully considered. Any rejection and/or objection not specifically addressed below is herein withdrawn.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 9-11, 19-21 and 23 are rejected under 35 U.S.C. 102(b) as being anticipated by Virtanen (WO 97/38940).

Virtanen disclose in claims 1, 7 and 8:

1. A method for recovering precipitated calcium carbonate, PCC, according to which method

- PCC is separated from the reaction mixture by filtration, and
- the PCC-containing precipitate collected onto a filter (3-5;21) is washed with water to separate by-products from the PCC,

characterized in that

- PCC is washed with washing water into which carbon dioxide is dissolved in an amount that is sufficient to convert at least a portion of the hydroxy compounds in the precipitate into the corresponding carbonate compounds.

7. The method according any of the preceding Claims, wherein a dispersing agent is added to the neutralized precipitate, whereafter the precipitate is suspended.

1.2

8. The method according to Claim 7, wherein dispersion is carried out in two stages such that most of the dispersing agent is added to the filter cake in the filter (3 - 5; 21), whereafter the filtered cake is suspended.

And from page 8, lines 13-22:

The dispersion step is most suitably carried out in two stages, whereby most of the dispersing agent is added to the filtered cake in the filter, whereafter the rest is added while the filtered cake is suspended. This enables adjusting the viscosity of the PCC suspension accurately to the desired value. Typically the desirable value for viscosity is, for example, 100 - 500 cP, preferably about 200 - 400 cP. The addition of dispersing agent in the filter is most suitably carried out such that about 60 % of the dispersing agent is added to the PCC cake in the filter. The pressure variation is the same as is used for washing, and the solids content of PCC is about 40 %. The aqueous filtrate is used for washing. The rest of the dispersing agent, that is, about 40 %, is only added to the mixer when the PCC cake is being resuspended. The material is dispersed rapidly as it already contains some dispersing

Thus Virtanen fairly discloses a method of that obtains a filter cake that is rapidly dispersed which applicant calls: "fluid mineral matter". Since water is disclosed by Virtanen then the solution would be aqueous. Since the dispersion filtration of claim 8 follows the water filtration of claim 1 then the steps are interpreted to be continuous.

Virtanen discloses on page 8, lines 8-11:

Because the PCC precipitate contains very small particles, the van der Waals forces between the crystals are quite strong, and it is not possible to manipulate the particles without the aid of a dispersing agent. Commonly known polyelectrolytes, like polyacrylate, may be used as the dispersing agent or disperser.

Virtanen discloses using high shear in the method (page 11, line 6). Virtanen discloses a use in paper coating (page 1, line 23).

Thus, instant claims 9-11, 19, 20, 21 and 23 are anticipated.

Response to arguments:

Applicant asserts that Virtanen does not disclose the instant two separate stages of filtration process and that Virtanen does not disclose a pre-layer of mineral matter is formed on the filtration membrane in the absence of a dispersing agent. Respectfully, the Examiner cannot agree. In line 3 of claim 1, Virtanen clearly discloses a filtration step in the absence of dispersing agent and continuous to this step the cake is filtered with a dispersing agent. Since the steps follow each other they are continuous. Applicant's arguments are not persuasive and the rejection is maintained.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 9-28 remain/are rejected under 35 U.S.C. 103(a) as being unpatentable over Bleakely et al. (US 5,833,747) in view of Izaki et al. (US 3,970,629).

Applicant claims:

9. (New) A process for the preparation of an aqueous suspension of fluid mineral matter from a concentrated cake comprising performing two separate stages of filtration, wherein in the first filtration stage, a pre-layer of mineral matter is formed on a filtration membrane in the absence of a dispersant agent, and in the second filtration stage, which is operated continuous to the first, the pre-layer is treated with a second aqueous suspension containing a dispersant agent to obtain a filtrate and a concentrated cake, wherein an aqueous suspension of fluid mineral matter is obtained from the concentrated cake.

Determination of the scope and content of the prior art

(MPEP 2141.01)

Bleakley et al. teach paper coating pigments and their production (title and abstract). Bleakley et al. teach precipitated calcium carbonate (PCC) products with dispersants (column 5, lines 29-44) present from 0.01 percent to 2.0 percent by weight based on the dry weight of the PCC present (column 5, lines 14-28). Bleakely et al. teach adding other pigments such as titanium dioxide (rutile type), kaoilin clay and ground calcium carbonate (column 5, lines 56-67 and column 8, lines 29-31).

Bleakley et al. teach a method of making an aqueous fluid suspension containing dry calcium carbonate comprising the steps of dewatering a suspension of ground precipitated calcium carbonate in a pressure filter (thus reading on compression) to give a solid cake and then redispersing the cake in water with 0.8 wt% sodium polyacrylate dispersing agent in a high shear mixer to give a fluid suspension (column 7 example 1 and column 8, Table 2).

Izaki et al. teach paper coating compositions comprising the pigment aluminum hydroxide (abstract and claims 1-13).

Ascertainment of the difference between the prior art and the claims

(MPEP 2141.02)

1. The difference between the instant application and Bleakley et al. is that Bleakley et al. do not expressly teach continuous filtration.

2. The difference between the instant application and Bleakley et al. is that Bleakley et al. do not expressly teach controlling the amount of dispersant in the filtrate by measurement of the electrical conductivity of the filtrate; stopping as soon as the conductivity increases and using a HI 8820N conductivity meter.

3. The difference between the instant application and Bleakley et al. is that Bleakley et al. do not expressly teach adding aluminum hydroxide as the mineral matter. This deficiency in Bleakely et al. is cured by the teachings of Izaki et al.

Finding of prima facie obviousness

Rational and Motivation (MPEP 2142-2143)

1. It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made to continuous filter the cake of Bleakley et al., and produce the instant invention.

One of ordinary skill in the art would have been motivated to do this because selection of any order of performing process steps is prima facie obvious in the absence of new or unexpected results. (In re Burhans, 154 F.2d 690, 69 USPQ 330 (CCPA

Art Unit: 1616

1946) (); In re Gibson, 39 F.2d 975, 5 USPQ 230 (CCPA 1930) (Selection of any order of mixing ingredients is prima facie obvious.)

2. It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made to controlling the amount of dispersant in the filtrate by measurement of the electrical conductivity of the filtrate; stopping as soon as the conductivity increases and using a HI 8820N conductivity meter the cake of Bleakley et al., and produce the instant invention.

One of ordinary skill in the art would have been motivated to do this because one of ordinary skill in the art might want to know how much dispersant is in the filtrate. It is the Examiner's position that since Bleakley et al. teach adding the **same amount** of the **same dispersant** as claimed by applicant and the only requirement is adding the dispersant to the cake then what does it matter what the conductivity of the filtrate is because the same amount of dispersant is added and it would have the same effect. This limitation appears to be superfluous to the Examiner because the same aqueous suspension of fluid mineral concentrate is obtained in the absence of evidence to the contrary.

3. It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made to add aluminum hydroxide, as suggested by Izaki et al. to the composition of Bleakley et al. and produce the instant invention.

One of ordinary skill in the art would have been motivated to do this because Bleakley et al. teach adding other pigments to the composition. "It is prima facie obvious to combine two compositions each of which is taught by the prior art to be useful for the

Art Unit: 1616

same purpose, in order to form a third composition to be used for the very same purpose.... [T]he idea of combining them flows logically from their having been individually taught in the prior art.” In re Kerkhoven, 626 F.2d 846, 850, 205 USPQ 1069, 1072 (CCPA 1980). A

In light of the forgoing discussion, the Examiner concludes that the subject matter defined by the instant claims would have been obvious within the meaning of 35 USC 103(a).

From the teachings of the references, it is apparent that one of ordinary skill in the art would have had a reasonable expectation of success in producing the claimed invention. Therefore, the invention as a whole was *prima facie* obvious to one of ordinary skill in the art at the time the invention was made, as evidenced by the references, especially in the absence of evidence to the contrary.

Response to arguments:

Applicant asserts that Bleakley does not teach a second filtration stage in which the pre-layer is treated with a second aqueous suspension containing a dispersant agent to obtain a filtrate and a concentrated cake. Respectfully, the Examiner cannot agree. Filtering to separate materials is commonly used technique by one of ordinary skill in the art of chemical sciences. Bleakley teaches the concept of filtering the material. Performing another filtration continuous to the first filtration is obvious to one of ordinary skill in the art. One of ordinary skill in the art can continuously filter the product of Bleakley numerous times including the fluid suspension containing the dispersant as in column 7, example 1 of Bleakley). Applicant has not shown the criticality of including

Art Unit: 1616

a second continuous filtration step. As stated above: selection of any order of performing process steps is prima facie obvious in the absence of new or unexpected results. (In re Burhans, 154 F.2d 690, 69 USPQ 330 (CCPA 1946) (); In re Gibson, 39 F.2d 975, 5 USPQ 230 (CCPA 1930) (Selection of any order of mixing ingredients is prima facie obvious.)

The art teaches filtration of the “fluid mineral matter” and one of ordinary skill in the art can filter the “fluid mineral matter” a hundred times but the concept remains taught by Bleakley.

Conclusion

No claims are allowed.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. US 4175066 teaches dispersant for calcium carbonate where the calcium carbonate is obtained by dewatering a slurry using a filter press and then dispersant and water are added to the cake to obtain a second slurry (Abstract and column 3, lines 32-50).
